**Microsurgery within the Hour! –
A guide to an efficient surgical treatment**

Adham Abdel Azim

Director of the Post-Graduate Program at University of the Pacific

The success rate of endodontic surgery has increased significantly over the past two decades with the implementation of micro-surgical techniques and improved retro-filling material. To this day, many clinicians consider endodontic surgery as the last resort for intervention. This is primarily due to the inefficiency while performing endodontic surgery as well as the stress associated with encountering certain surgical procedures. In this presentation we will provide guides to clinicians on how to overcome these hurdles and successfully complete endodontic microsurgical procedures in the anterior or the posterior region within one hour.

At the end of this presentation, participants should learn:

- 1 - Adequate treatment planning in endodontic microsurgery
- 2 - Proper utilization of the endodontic microsurgical armamentarium
- 3 - How to save time in each step of the surgical procedure
